

STANDARD CRANES

KULI Standard cranes solve transport problems.

They are manufactured from standardized components all of which are produced in series. This allows a standard crane to be designed to suit individual requirements as to span, headroom, duty and service conditions. We supply single girder, double girder, suspension and gantry type cranes ranging from 1t to 125 t capacity.

Single girder cranes

Most favourable dimensions in design and headroom allow reducing cost of erecting building construction and of its maintenance.

KULI
STANDARD CRANES

Double girder cranes

The use of standardized travel drives and hoists allow constructions to adapt the cranes to space available and to kind of operation at moderate cost.

Options

- variable frequency speed controlled drives
- Radio control
- Magnets
- Weighing systems

Member of F.E.M. (Germany)

Gantry cranes

KULI Gantry Cranes are manufactured in different executions with suspended monorail hoist, with cantilevered trolley hoist or with double girder crab hoist. One or several hoists can be applied, also for container handling. Gantry cranes with two supports only permit easy turning of long loads at the short cantilever.
